

Abstract

Disclosed is a method for producing single microlenses or an arrays of microlenses composed of a glass-type material, in which method a first substrate is provided with a surface containing impressions over which a second substrate composed of a glass-type material is placed at least partially overlapping it and is joined therewith under vacuum conditions, and in which method the substrate composite is tempered in such a manner that the second substrate softens and flows into the impressions of the first substrate, thereby structuring the side of the second substrate facing away from the first substrate in order to form at least one microlens surface.

The invention is distinguished in that for forming the at least one microlens surface, the softened glass-type material of the second substrate flows into at least two impressions of the first substrate, the shape, size and arrangements of the two impression determining the curvature of the forming microlens surface.
